

Some Notes about the things I encountered

Simon Pohmann

June 16, 2022

Notation

If E is an Elliptic Curve defined over a finite field of characteristic p , we write $E^{(p)}$ for the curve defined by the equations of E after replacing all coefficients by their p -th power. Similarly, for an isogeny $\phi : E \rightarrow E'$, write $\phi^{(p)} : E^{(p)} \rightarrow E'^{(p)}$ for the isogeny defined by the polynomials of ϕ after replacing all coefficients by their p -th power. Furthermore, for a point $P = (x : y : z) \in \mathbb{P}^2$ write $P^{(p)} := (x^p : y^p : z^p)$. Finally, for a set of points or endomorphisms S write $S^{(p)} := \{s^{(p)} \mid s \in S\}$. Note that

$$\begin{aligned} \cdot^{(p)} : \mathbf{Ell} &\rightarrow \mathbf{Ell}, & E &\mapsto E^{(p)} \\ \mathrm{Hom}_{\mathbf{Ell}}(E, E') &\ni \phi &\rightarrow \phi^{(p)} \end{aligned}$$

is a covariant endofunctor on the category \mathbf{Ell} of Elliptic Curves defined over $\bar{\mathbb{F}}_p$ and their isogenies.

Sometimes, we abuse terminology and speak of Elliptic Curves when we mean isomorphism classes of Elliptic Curves.

Many examples will be over \mathbb{F}_{101^2} . Let $p = 101$ and $q = p^2$. We usually use the generator $\alpha \in \mathbb{F}_q$ with minimal polynomial $x^2 + 97x + 2$.

1 Example - The cases I, II and III

For the analysis of these cases, we consider an ordinary Elliptic Curve E/\mathbb{F}_{p^2} , a prime l and the curve E_0 , defined as the curve on the crater of the l -isogeny volcano that is the root of the subtree containing E . In other words, E_0 is the curve on the crater that is closest to E , and there is a path of ascending l -isogenies $E \rightarrow \dots \rightarrow E_0$. Finally, if E is already on the crater, then clearly $E = E_0$.

1.1 Case I

We say that we are in *Case I*, if $E_0 = E_0^{(p)}$, i.e. E_0 is defined over \mathbb{F}_p .

Finding examples of case I is trivial - just take a curve E with $j(E) \in \mathbb{F}_p$. Then clearly $E^{(p)} = E$ and so also $E_0^{(p)} = E_0$ (since $\cdot^{(p)}$ maps the path $E \rightarrow E_0$ to $E = E^{(p)} \rightarrow E_0^{(p)}$).

are more or less two possibilities for the $\cdot^{(p)}$ conjugate path¹.

- It could be that the conjugate of $E_i \rightarrow E_{i+1}$ is the dual of $E_{n-i-1} \rightarrow E_{n-i}$, hence we just go the path $E \rightarrow \dots \rightarrow E^{(p)}$ backwards.
- It could be that the conjugate of $E_i \rightarrow E_{i+1}$ is $E_{n+i} \rightarrow E_{n+i+1}$, where

$$E_0, \dots, E_n, E_{n+1}, \dots, E_{n+m} = E_0$$

is the cycle along the whole crater.

However, as we will see, the first case is impossible.

Note that we have

Proposition 1.1. *Let $[\mathfrak{b}] \in \text{Cl}(\mathcal{O})$ where $\mathcal{O} = \text{End}(E)$ for an ordinary Elliptic Curve E/\mathbb{F}_{p^2} such that $[\mathfrak{b}].E = E^{(p)}$. Then $[\mathfrak{b}]^2 = [(1)]$.*

Proof. I think there is some mistake with my definition of the class group action, see also the next paragraph. With the current (probably wrong) definition, the following works. Otherwise, I suppose that anyway we have $[\mathfrak{b}] = [(p, \pi)]$ and then the claim follows by Lemma 2.5.

We recall the definition of the class group action in the case $[\mathfrak{b}].E^{(p)}$. For an ideal $\mathfrak{b}' \leq \text{End}(E^{(p)})$, have by definition

$$[\mathfrak{b}'].E^{(p)} = E^{(p)}/E^{(p)}[\mathfrak{b}'] = E^{(p)} / \bigcap_{\beta \in \mathfrak{b}'} \ker(\beta)$$

However, \mathfrak{b} is an ideal in $\text{End}(E)$, which is only isomorphic to $\text{End}(E^{(p)})$. Since $\text{End}^0(E)$ is a quadratic imaginary number field, it has one nontrivial field automorphism, and thus the isomorphism $\text{End}(E) \cong \text{End}(E^{(p)})$ is not unique. But there is a unique canonical isomorphism, i.e. an isomorphism that is induced by an (equivalently any) isogeny $\phi : E \rightarrow E^{(p)}$ as

$$\Phi_* : \text{End}(E) \rightarrow \text{End}(E^{(p)}), \quad \alpha \mapsto \frac{1}{\deg(\phi)} \phi \circ \alpha \circ \hat{\phi}$$

This is the isomorphism we use, i.e. we say

$$E^{(p)}[\mathfrak{b}] = E^{(p)}[\Phi_*(\mathfrak{b})] \quad \text{and} \quad [\mathfrak{b}].E^{(p)} = [\Phi_*(\mathfrak{b})].E^{(p)} = E^{(p)}/E^{(p)}[\mathfrak{b}]$$

Now let $\phi : E \rightarrow E/E[\mathfrak{b}] = E^{(p)}$ be a separable isogeny with kernel $E[\mathfrak{b}]$ (by choosing the representative \mathfrak{b} of $[\mathfrak{b}] \in \text{Cl}(\mathcal{O})$ correspondingly, we can assume that). We have

$$\ker(\phi^{(p)}) = E[\mathfrak{b}]^{(p)} = \bigcap_{\beta \in \mathfrak{b}} \ker(\beta)^{(p)} = \bigcap_{\beta \in \mathfrak{b}} \ker(\beta^{(p)}) = \bigcap_{\beta \in \mathfrak{b}^{(p)}} \ker(\beta)$$

¹Remember that $\cdot^{(p)}$ is functorial, hence we can also apply to isogenies $E_i \rightarrow E_{i+1}$

Figure 2: A 3-isogeny vulcano over $\mathbb{F}_{101^2} = \mathbb{F}_{101}[\alpha]$ that satisfies case III (in the plot have $z = \alpha$).

Now note that the Frobenius isogeny $\pi : E \rightarrow E^{(p)}$, $P \mapsto P^{(p)}$ induces the canonical isomorphism $\text{End}(E) \rightarrow \text{End}(E^{(p)})$ and so the image of \mathfrak{b} under that isomorphism is $\mathfrak{b}' = \mathfrak{b}^{(p)} \leq \text{End}(E^{(p)})$. Thus

$$\bigcap_{\beta \in \mathfrak{b}^{(p)}} \ker(\beta) = \bigcap_{\beta \in \mathfrak{b}'} \ker(\beta) = E^{(p)}[\mathfrak{b}'] = E^{(p)}[\mathfrak{b}]$$

So by the uniqueness of the image curve for an isogeny with fixed kernel yields that $E = \text{im}(\phi^{(p)}) = [\mathfrak{b}].E^{(p)}$. Thus $[\mathfrak{b}]^2.E = [\mathfrak{b}].E^{(p)} = E$ and since the class group action is free, we see that $[\mathfrak{b}]^2 = [(1)]$. \square

From this we get the

Corollary 1.2. *Assume that $E = E_0 \rightarrow E_1 \rightarrow \dots \rightarrow E_n = E$ is the cycle once around the crater (and $j(E) \in \mathbb{F}_{p^2} \setminus \mathbb{F}_p$). If $E^{(p)} = E_i$ then n is even and $i = n/2$, i.e. $E^{(p)}$ is*

on the other side of the crater².

Proof. If l does not split in \mathcal{O}_K , then the crater has at most two elements and this is trivial. So assume $(l) = \mathfrak{l}_1 \mathfrak{l}_2$. It is known that then the action of $[\mathfrak{l}_1]$ resp. $[\mathfrak{l}_2]$ corresponds to walking around the crater in one direction resp. the other. So wlog $[\mathfrak{l}_1].E_i = E_{i+1}$.

Now assume that $E^{(p)} = E_i$, so $[\mathfrak{b}].E = E_i = [\mathfrak{l}_1]^i.E$. Since the action is free, it follows that $[\mathfrak{b}] = [\mathfrak{l}_1]^i$. By the previous theorem, we have now $[\mathfrak{l}_1]^{2i} = [\mathfrak{b}]^2 = [(1)]$ and so $[\mathfrak{l}_1]^{2i}.E = E_{2i} = E$. Thus $i = n/2$ and the claim follows. \square

In particular, the path between E and $E^{(p)}$ is likely to have length $\omega(\log(p))$, since the crater is usually large. This is displayed e.g. Figure 1.

1.3 Case III

We say we are in *Case III*, if E_0 and $E_0^{(p)}$ are in different l -isogeny volcanos, i.e. there is no l -isogeny path between them.

We give the example displayed in Figure 3. Consider E with $j(E) = 64\alpha + 5$. Then $j(E^{(p)}) = j(E)^p = 37\alpha + 59$. However, we have that E lies on the crater, together with curve of j -invariants

$$88\alpha + 70, 54\alpha + 52, 95\alpha + 11$$

Hence there is no 3-isogeny path from E to $E^{(p)}$. Note that $[\mathcal{O}_K : \mathbb{Z}[\pi]] = 2^2 \cdot 3^2$ but $[\mathcal{O}_K : \text{End}(E)] = 2^2$, which shows that E lies on the crater.

Now we want to have a closer look onto the class group action in this case. Have $d(\text{End}(E)) = -320$, so $K = \mathbb{Q}(\sqrt{-5})$ and $d(\mathcal{O}_K) = -5$. Hence, we have $\text{End}(E) \cong \mathbb{Z}[4\sqrt{-5}]$ and $\mathcal{O}_K \cong \mathbb{Z}[\sqrt{-5}]$.

Sage tells us that $h(\mathcal{O}_K) = 2$ and $h(\text{End}(E)) = 8$. With this, we can already see that

$$64\alpha + 5, 88\alpha + 70, 54\alpha + 52, 95\alpha + 11$$

and

$$(64\alpha + 5)^p, (88\alpha + 70)^p, (54\alpha + 52)^p, (95\alpha + 11)^p$$

is the set of j -invariants of all Elliptic Curves with endomorphism ring $\cong \text{End}(E)$. On this set, $\text{Cl}(\mathbb{Z}[4\sqrt{-5}])$ then acts freely and transitively. Now it would be of course interesting to find out how $\text{Cl}(\mathbb{Z}[4\sqrt{-5}])$ really looks like.

2 Properties of the endomorphism ring vs the cases

Proposition 2.1. *Let E be an ordinary Elliptic Curve defined over a finite field of characteristic p .*

- $\text{End}(E)$ has an element of norm p iff $j(E) \in \mathbb{F}_p$.
- $\text{End}(E)$ has a nontrivial element (i.e. $\neq \epsilon p$ for a unit ϵ) of norm p^2 iff $j(E) \in \mathbb{F}_{p^2}$.

²Note that this does not hold if $E, E^{(p)}$ are not in the same crater, see Figure 2.

Figure 3: A 3-isogeny volcano over $\mathbb{F}_{101^2} = \mathbb{F}_{101}[\alpha]$ that satisfies case III (in the plot have $z = \alpha$).

Proof. The directions \Leftarrow is clear, as the norm of the q -th power Frobenius endomorphism is q .

For the direction \Rightarrow , assume there is an element $\alpha \in \text{End}(E)$ with $N(\alpha) = p$. If α is inseparable (as isogeny), then we have that it factors through the p -th power Frobenius endomorphism π , and thus $\alpha = \lambda \circ \pi$ for an isomorphism $\lambda : E^{(p)} \rightarrow E$. Thus $j(E^{(p)}) = j(E)$.

On the other hand, if α is separable, it must have kernel of size p , so $\ker(\alpha) = E[p]$ since $\#E[p] = p$ (E is ordinary). Thus $\ker(\alpha) \subseteq \ker([p])$ and we see that $[p]$ factors through α as $[p] = \psi \circ \alpha$. Now have that $\deg(\psi) = p = p^2/\deg(\alpha)$ and clearly ψ is inseparable. The claim follows as above.

For the second point, assume $\alpha \in \text{End}(E)$ has norm $N(\alpha) = p^2$ and $\alpha \neq \pm p$. If α is purely inseparable, we are done. If α is separable, its kernel must be $E[p^2]$ and so it factors through $[p^2]$. Since $[p^2]$ has inseparability degree p^2 , we see that $[p^2] = \pi^2 \circ \alpha$ where π is the p -th power Frobenius morphism. Since α is an endomorphism of E , find $\pi^2 : E \rightarrow E$, thus $j(E) \in \mathbb{F}_{p^2}$.

Finally, if α has inseparability degree p , then its kernel must be $E[p]$ and so $\alpha = \beta \circ \pi$ where $\beta : E^{(p)} \rightarrow E$ is separable with kernel $E^{(p)}[p]$. However, by the uniqueness of the separable isogeny with kernel $E^{(p)}[p]$, we know that (up to isomorphism) also $[p]$ is $\beta \circ \pi$. This now implies that $\alpha = \epsilon p$ for some unit ϵ . \square

Corollary 2.2. *Let $D < 0$. Then the curves E with $\text{End}(E) = \mathbb{Z}[\sqrt{D}]$ have $j(E) \in \mathbb{F}_{p^2} \setminus \mathbb{F}_p$ if and only if*

$$a^2 - b^2 D = p$$

has no solution $a, b \in \mathbb{Z}$ and

$$a^2 - b^2 D = p^2$$

has a nontrivial solution $a, b \in \mathbb{Z}$.

Let E/\mathbb{F}_{p^2} be an ordinary Elliptic Curve and write $\mathcal{O} := \text{End}(E)$, $\mathcal{K} := \text{End}(E) \otimes \mathbb{Q}$. Let π be the $q = p^2$ -th power Frobenius endomorphism and let t be its trace. Assume $p \neq 2$.

Lemma 2.3. *Have $(p) = (p, \pi)(p, \pi - t)$ in $\mathbb{Z}[\pi]$, \mathcal{O} resp. $\mathcal{O}_{\mathcal{K}}$.*

Proof. Have

$$(p, \pi)(p, \pi - t) = (p^2, p\pi, p\pi - pt, \pi^2 - t\pi) = (p^2, pt, p\pi, -p^2) = (up^2 + vtp, \dots) = (p)$$

where $up + vt = 1$ (note that $t \perp p$ since E is ordinary). \square

Lemma 2.4. *(p, π) is principal (in \mathcal{O}) if and only if E/\mathbb{F}_p .*

Proof. If (p, π) is principal, then its generator is an element of norm p , so E/\mathbb{F}_p . On the other hand, if E/\mathbb{F}_p , then the p -th power Frobenius endomorphism π_p satisfies $p = \pi_p(t_p - \pi_p)$, $\pi = \pi_p^2$ and $\pi_p = u(\pi + p) + v\pi_p p$, where t_p is its trace and $ut + vp = 1$. \square

There must be some problem in my definition of the class group action, as it can happen that $[(p, \pi)]$ is not $[(1)]$, but $E[(p, \pi)]$ is clearly trivial, so³ $(p, \pi).E = E/E[(p, \pi)] = E$. However, this contradicts the freeness of the class group action.

Lemma 2.5. *Assume $j(E) \neq 0, 1728$ (and E is defined over \mathbb{F}_{p^2}). $[(p, \pi)]$ has order ≤ 2 in $\text{Cl}(\mathcal{O})$ resp. $\text{Cl}(\mathcal{O}_K)$.*

Proof. Since E/\mathbb{F}_{p^2} , we know that there is a nontrivial element α of norm p^2 . Now have in \mathcal{O}_K that $(\alpha)|(p)^2$ and with $p = (p, \pi)(p, \pi - t)$ have thus $(\alpha) = (p)$ or $(\alpha) = (p, \pi)^2$ or $(\alpha) = (p, \pi - t)^2$. However, by assumption we only have units ± 1 in \mathcal{O}_K resp. \mathcal{O} , so the first case is impossible, as it implies $\alpha = \pm p$.

Note that $[(p, \pi)] = [(p, \pi - t)^{-1}]$, so wlog assume $(\alpha) = (p, \pi)^2$. It follows that $(p, \pi)^2$ is principal, so $[(p, \pi)]^2 = [(1)]$. \square

3 Ideals in \mathcal{O} resp. \mathcal{O}_K

In this paragraph, I tried to improve my understanding of ideals, invertible ideals and the class group in a nonmaximal order in a quadratic imaginary number field. In particular, I was interested in which properties carry over from \mathcal{O}_K and which do not hold anymore.

Consider an ordinary Elliptic Curve E/\mathbb{F}_q , $\mathcal{O} := \text{End}(E)$, $K := \mathcal{O} \otimes \mathbb{Q}$ and \mathcal{O}_K the ring of integers in K . Assume that $j(E) \in \mathbb{F}_q$ is not contained in any proper subfield of \mathbb{F}_q and let π be the q -th power Frobenius endomorphism. Let t be its trace.

Proposition 3.1. $p \nmid d(\mathcal{O})$

Proof. Have that

$$d(\mathbb{Z}[\pi]) = t^2 - 4q \perp p$$

since $t \perp p$ as E is ordinary. The claim follows since $d(\mathcal{O}) \mid d(\mathcal{O})[\mathcal{O} : \mathbb{Z}[\pi]]^2 = d(\mathbb{Z}[\pi])$. \square

Proposition 3.2. *Let $\mathfrak{a} \leq \mathcal{O}$. Then $\mathfrak{a} \cap \mathbb{Z} = (a)$ with $a \mid [\mathcal{O} : \mathfrak{a}] \mid a^2$. Note that if $\mathfrak{a} = \mathfrak{p}$ is prime, then trivially a must be prime.*

Proof. Clearly $[\mathcal{O} : \mathfrak{a}] \in \mathfrak{a}$ as $1 \in \mathcal{O}/\mathfrak{a}$ has order dividing $\#(\mathcal{O}/\mathfrak{a}) = [\mathcal{O} : \mathfrak{a}]$, so $a \mid [\mathcal{O} : \mathfrak{a}]$. On the other hand, have $[\mathcal{O} : \mathfrak{a}] \mid [\mathcal{O} : a\mathcal{O}] = a^2$. \square

Lemma 3.3. *Let $\mathfrak{p} \leq \mathcal{O}_K$ be a prime with $\mathfrak{N}(\mathfrak{p}) \perp [\mathcal{O}_K : \mathcal{O}]$. Then \mathfrak{p} has a set of generators in \mathcal{O} .*

Proof. Suppose \mathfrak{p} is a prime over p , and let $\mathcal{O} = \mathbb{Z}[\phi]$. We use the decomposition law in Dedekind ring extensions. Since $\mathfrak{N}(\mathfrak{p}) \perp [\mathcal{O}_K : \mathcal{O}]$ are coprime, we can apply it with generator ϕ of \mathcal{O} .

If $\text{MiPo}(\phi) = f(X)g(X) \pmod{p}$ splits, then have

$$p\mathcal{O}_K = (p, f(\phi))(p, g(\phi))$$

³We know that (p, π) is invertible, as $\frac{1}{p}(p, \pi)(p, \pi - t) = (1)$.

and so the prime ideals over p are $(p, f(\phi))$ and $(p, g(\phi))$. If $\text{MiPo}(\phi) \bmod p$ is irreducible, then have that $p\mathcal{O}_K$ is prime and thus the only prime ideal over p . Hence, all prime ideals over p (including \mathfrak{p}) have a set of generators in \mathcal{O} . \square

Corollary 3.4. *Let $\mathfrak{a} \leq \mathcal{O}_K$ be an ideal with $\mathfrak{N}(\mathfrak{a}) \perp [\mathcal{O}_K : \mathcal{O}]$. Then \mathfrak{a} has a set of generators in \mathcal{O} .*

Proposition 3.5. *Let $\mathfrak{p} \leq \mathcal{O}$ be a prime ideal with $\mathfrak{N}(\mathfrak{p}) \perp [\mathcal{O}_K : \mathcal{O}]$ and $\mathfrak{p}' = \mathfrak{p}\mathcal{O}_K$. Then $\mathcal{O}_{\mathfrak{p}} = (\mathcal{O}_K)_{\mathfrak{p}'}$.*

Proof. We have $\mathcal{O}_K = \mathbb{Z}[\alpha]$ and $\mathcal{O} = \mathbb{Z}[f\alpha]$ where $f = [\mathcal{O}_K : \mathcal{O}]$. Thus $f \notin \mathfrak{p}$ and so $f \in \mathcal{O}_{\mathfrak{p}}^*$. Therefore $\mathcal{O}_K \subseteq \mathcal{O}_{\mathfrak{p}}$ and thus $(\mathcal{O}_K)_{\mathfrak{p}'} \subseteq \mathcal{O}_{\mathfrak{p}}$. \square

Proposition 3.6. *Let $\mathfrak{I}(\mathcal{O})$ resp. $\mathfrak{I}(\mathcal{O}_K)$ denote the set of invertible ideals of norm $\perp [\mathcal{O}_K : \mathcal{O}]$. Then*

$$\mathfrak{I}(\mathcal{O}) \rightarrow \mathfrak{I}(\mathcal{O}_K), \quad \mathfrak{a} \mapsto \mathfrak{a}\mathcal{O}_K$$

is a monoid isomorphism with inverse

$$\mathfrak{I}(\mathcal{O}_K) \rightarrow \mathfrak{I}(\mathcal{O}), \quad \mathfrak{a} \mapsto \mathfrak{a} \cap \mathcal{O}$$

Proof. Clearly, this is a well-defined monoid homomorphism. Hence, we have to show that it is bijective.

By Corollary 3.4, we know that any $\mathfrak{a} \leq \mathcal{O}_K$ with $\mathfrak{N}(\mathfrak{a}) \perp [\mathcal{O}_K : \mathcal{O}]$ has generators in \mathcal{O} , thus $(\mathfrak{a} \cap \mathcal{O})\mathcal{O}_K = \mathfrak{a}$. This shows that $\mathfrak{a} \cap \mathcal{O}$ is a preimage of \mathfrak{a} , and so the map is surjective.

Assume now $\mathfrak{a}, \mathfrak{b} \leq \mathcal{O}$ with $\mathfrak{a}\mathcal{O}_K = \mathfrak{b}\mathcal{O}_K$ and $\mathfrak{N}(\mathfrak{a}), \mathfrak{N}(\mathfrak{b}) \perp [\mathcal{O}_K : \mathcal{O}]$. We show that $\mathfrak{a}_{\mathfrak{p}} = \mathfrak{b}_{\mathfrak{p}}$ for all primes $\mathfrak{p} \leq \mathcal{O}$. Note that if $\mathfrak{N}(\mathfrak{p}) \not\perp [\mathcal{O}_K : \mathcal{O}]$, this holds trivially, as $\mathfrak{a}_{\mathfrak{p}} = \mathcal{O}_{\mathfrak{p}} = \mathfrak{b}_{\mathfrak{p}}$. Otherwise, note that

$$\mathfrak{a}_{\mathfrak{p}} = \mathfrak{a}_{\mathfrak{p}}\mathcal{O}_{\mathfrak{p}} = \mathfrak{a}(\mathcal{O}_K)_{\mathfrak{p}} = \mathfrak{a}\mathcal{O}_K(\mathcal{O}_K)_{\mathfrak{p}} = \mathfrak{b}\mathcal{O}_K(\mathcal{O}_K)_{\mathfrak{p}} = \mathfrak{b}_{\mathfrak{p}}(\mathcal{O}_K)_{\mathfrak{p}} = \mathfrak{b}_{\mathfrak{p}}$$

as $\mathcal{O}_{\mathfrak{p}} = (\mathcal{O}_K)_{\mathfrak{p}}$. This shows that $\mathfrak{a}_{\mathfrak{p}} = \mathfrak{b}_{\mathfrak{p}}$ at all primes, so $\mathfrak{a} = \mathfrak{b}$ and our map is injective. Furthermore, since $(\mathfrak{a} \cap \mathcal{O})\mathcal{O}_K = \mathfrak{a}$, we see that it has the inverse

$$\mathfrak{I}(\mathcal{O}_K) \rightarrow \mathfrak{I}(\mathcal{O}), \quad \mathfrak{a} \mapsto \mathfrak{a} \cap \mathcal{O}$$

which must then be well-defined. \square

Proposition 3.7. *Let $\mathfrak{a} \leq R$ be a radical ideal in a commutative unital ring R . If $\alpha \in \mathfrak{p}$ for all primes $\mathfrak{p} \supseteq \mathfrak{a}$ then $\alpha \in \mathfrak{a}$.*

Proof. We have that $\mathfrak{a}_{\alpha} \neq (1)$ otherwise $\alpha^n \in \mathfrak{a}$, so $\alpha \in \mathfrak{a}$. Thus $\mathfrak{a}_{\alpha} \subseteq \mathfrak{m}$ for a maximal ideal $\mathfrak{m} \leq R_{\alpha}$. A preimage under $R \rightarrow R_{\alpha}$ is now a prime \mathfrak{p} with $\mathfrak{a} \subseteq \mathfrak{p}$ and $\alpha \notin \mathfrak{p}$. \square

Corollary 3.8. *If $q \perp d(\mathcal{O})$ is an integer and $q \mid \alpha$ in \mathcal{O}_K , then also $q \mid \alpha$ in \mathcal{O} .*

Proof. It suffices to prove this for primes q . Since $q \nmid d(\mathcal{O})$, we know that (q) is unramified, hence radical. Now observe that $\mathcal{O}_{\mathfrak{p}} = (\mathcal{O}_K)_{\mathfrak{p}}$ for primes \mathfrak{p} over q and so $\alpha \in \mathfrak{p}$ for all primes \mathfrak{p} over q . The previous proposition now shows that $\alpha \in (q)$. \square

4 More on the diophantine equations

Lemma 4.1. *Let $D < 0$ and \mathcal{O} be the imaginary quadratic order of discriminant D . Then $1, \alpha$ with $\alpha = \frac{D+\sqrt{D}}{2}$ is a \mathbb{Z} -basis of \mathcal{O} and*

$$N(a + b\alpha) = \left(a + \frac{D}{2}b\right)^2 - \frac{D}{4}b^2$$

Proof.

$$\begin{aligned} N(\alpha) &= a^2 + ab\frac{D+\sqrt{D}}{2} + ab\frac{D-\sqrt{D}}{2} + \frac{D^2-D}{4}b^2 = a^2 + Dab + \frac{D^2-D}{4}b^2 \\ &= \left(a + \frac{D}{2}b\right)^2 - \frac{D}{4}b^2 \end{aligned}$$

□

Corollary 4.2. *Let l be a prime and $D < 0$. Let \mathcal{O} be the quadratic imaginary order of discriminant D . If there exists a nontrivial element $\alpha \in \mathcal{O}$ of norm l^e (i.e. $\alpha \notin \mathbb{Z}$), then*

$$e \geq \log_l(-D) - \log_l(4)$$

Corollary 4.3. *Let $E/\bar{\mathbb{F}}_p$ be an ordinary Elliptic Curve such that $\text{End}(E)$ has discriminant D . Suppose that $j(E_0) \notin \mathbb{F}_p$ and l is not ramified in $\text{End}(E) \otimes \mathbb{Q}$. Then the shortest l -isogeny path between E and $E^{(p)}$ has length at least*

$$\frac{1}{2} \log_l(-D) - \log_l(2)$$

Proof. First, define E_0 to be the corresponding curve on the crater of the l -isogeny volcano. Let $v \in \mathfrak{N}$ be maximal with $l^v \mid [\text{End}(E_0) : \text{End}(E)]$, so $\text{End}(E_0)$ has discriminant D/l^v . Now we know that $E_0^{(p)}$ is at the opposite side of the crater, and the size of the crater is the order of $[l_1]$ in $\text{Cl}(\text{End}(E_0))$ where $l = l_1 l_2$. If e is this order, then have that $l^e = (\alpha)$ is principal. Note that $\alpha \notin \mathbb{Z}$, otherwise we would have $\alpha = \pm l^{e/2}$, but since $(\alpha) = l_1^e$, we know that $l_2 \nmid (\alpha)$ (here we use that $l_1 \neq l_2$, i.e. l is unramified).

So

$$e \geq \log_l(-D/l^v) - \log_l(4)$$

Thus, the distance of E_0 and $E_0^{(p)}$ is at least

$$\frac{1}{2}e \geq \frac{1}{2} \log_l(-D/l^v) - \frac{1}{2} \log_l(4) = \frac{1}{2} \log_l(-D) - \frac{1}{2}v - \log_l(2)$$

However, the shortest path from E to E_0 has length v , and similarly for the shortest path from $E^{(p)}$ to $E_0^{(p)}$. Thus we find that the length of the shortest path from E to $E^{(p)}$ is at least

$$\frac{1}{2} \log_l(-D) - \frac{1}{2}v - \log_l(2) + 2v \geq \frac{1}{2} \log_l(-D) - \log_l(2)$$

Table 1: Table of class numbers of $\text{End}(E)$ for Elliptic Curves $E/\mathbb{F}_{101^2} = \mathbb{F}_{101}[\alpha]$. Note that the j -values are not uniformly chosen, in particular, j -values that lead to a conductor $[\mathcal{O}_K : \mathbb{Z}[\pi]]$ with “big” prime power divisors have been ignored, as the current implementation of computing the endomorphism ring would take ages for them.

5 Example - j-invariant $61\alpha + 16$

Let E be an Elliptic Curve defined over \mathbb{F}_{101^2} with j-invariant $61\alpha + 16$. Then the q -th power Frobenius π has minimal polynomial

$$X^2 - 190X + 10201$$

Furthermore, we find that $\text{End}(E) = \mathcal{O}_{\mathcal{K}}$ for $\mathcal{K} = \mathbb{Q}(\sqrt{-6})$. So

$$\pi = \frac{190 + 28\sqrt{-6}}{2} = 95 + 14\sqrt{-6}$$

or

$$\sqrt{-6} = \frac{\pi - 95}{14}$$

Note that $\pi - 95$ has norm $2^3 \cdot 3 \cdot 7^2$. The class group of \mathcal{O} has order 2, and a generator is e.g. the coset of $(2, \sqrt{-6})$. Hence, to find $E[(2, \sqrt{-6})]$ we need to find

$$\ker\left(\frac{\pi - 95}{14}\right) \cap E[2] = 14 \ker(\pi - 95) \cap E[2] = 14(\ker(\pi - 95) \cap E[28])$$

Now choose a $\mathbb{Z}/4\mathbb{Z}$ -basis P_1, P_2 of $E[4]$ and a $\mathbb{Z}/7\mathbb{Z}$ -basis Q_1, Q_2 of $E[7]$. Have that w.r.t. these basis, π is given by the matrices

$$\begin{pmatrix} 3 & 2 \\ 0 & 3 \end{pmatrix} \quad \text{resp.} \quad \begin{pmatrix} 4 & 0 \\ 0 & 4 \end{pmatrix}$$

Since $95 \equiv 3 \pmod{4}$ and $95 \equiv 4 \pmod{7}$, we see that $\ker(\pi - 95) \cap E[28]$ projects to

$$\langle P_1, 2P_2 \rangle \subseteq E[4] \quad \text{and} \quad E[7] \subseteq E[7]$$

and thus is $E[14] + \langle P_1 \rangle$. This implies that $E[(2, \sqrt{-6})] = \langle 2P_1 \rangle$. Note that we picked

$$\begin{aligned} P_1 &= (59 + 7\alpha, 48 + 75\alpha + (73 + 3\alpha)t), \\ P_2 &= (7 + 17\alpha + 100t, 71 + 72\alpha + (31 + 88\alpha)t) \end{aligned}$$

before, where t has minimal polynomial $(24 + 51\alpha) + (94 + 84\alpha)T + T^2$. Hence, $\overline{(2, \sqrt{-6})}.E$ is the (isomorphism class of the) image of the 2-isogeny $\phi : E \rightarrow E/\langle 2P_1 \rangle$, which is

$$j(E/\langle 2P_1 \rangle) = 40\alpha + 58 = (61\alpha + 16)^{101}$$

The 2-isogeny vulcano containing $61\alpha + 16$ is shown in

To find the whole kernel, pick a $\mathbb{Z}/8\mathbb{Z}$ -basis P_1, P_2 of $E[8]$, a $\mathbb{Z}/3\mathbb{Z}$ -basis Q_1, Q_2 of $E[3]$ and a $\mathbb{Z}/49\mathbb{Z}$ -basis R_1, R_2 of $E[49]$. Find then that modulo 8, 3 resp. 49, π is given by the matrix

$$\begin{pmatrix} 3 & 6 \\ 4 & 3 \end{pmatrix} \quad \text{resp.} \quad \begin{pmatrix} 2 & 1 \\ 0 & 2 \end{pmatrix} \quad \text{resp.} \quad \begin{pmatrix} 32 & 14 \\ 0 & 11 \end{pmatrix}$$

Figure 4: The 2-isogeny vulcano containing $61\alpha+16$. Note that 2 is ramified in $\text{End}(E) \otimes \mathbb{Q}$, thus the crater only has size 2.

6 Example - The ordinary endomorphism ring

The information in this section is all known material - I just wanted to understand properly how one can compute the endomorphism ring, and what problems occur.

Consider the finite field

$$\mathbb{F}_q = \mathbb{F}_{37^2} = \mathbb{F}_{37} + \alpha\mathbb{F}_{37}$$

where $\alpha^2 + 33\alpha + 2 = 0$. Further, consider the Elliptic Curve E/\mathbb{F}_q with j -invariant 3α , given by

$$E : y^2 = x^3 + (15\alpha + 17)x + (5\alpha + 3)$$

Then we find that the q -th power Frobenius endomorphism π satisfies the minimal equation

$$\pi^2 + 47\pi + 1369$$

and in particular, its trace is -47 . Hence, the number field $\mathcal{K} := \mathcal{O} \otimes \mathbb{Q}$ where $\mathcal{O} = \text{End}(E)$ contains $\sqrt{47^2 - 4 \cdot 1369} = \sqrt{-3^3 \cdot 11^2}$. We observe that $\mathcal{K} = \mathbb{Q}(\sqrt{-3})$ and has discriminant -3 . Furthermore the ring of integers is $\mathcal{O}_{\mathcal{K}} = \mathbb{Z}[\frac{1}{2}(1 + \sqrt{-3})]$.

Knowing the number field, we want to find the endomorphism ring. First, observe that the Frobenius order $\mathbb{Z}[\pi]$ has conductor 33. Now consider the endomorphism

$$\phi := 2\pi + 47$$

The advantage is that we can evaluate ϕ on points of E , but evaluating $\pi + 47/2$ is not so easy. Clearly $[\mathbb{Z}[\pi] : \mathbb{Z}[\phi]] = 2$ and so $\mathbb{Z}[\phi]$ has conductor 66.

Torsion points

In order to find whether $\phi/n \in \mathcal{O}$, we factor $66 = 2 \cdot 3 \cdot 11$ and compute the corresponding torsion groups. This turns out to be quite difficult.

Assume $\mathbb{F}_{37^{12}} = \mathbb{F}_{37}[\beta]$ with

$$\text{MiPo}_{\mathbb{F}_{37}}(\beta) = x^{12} + 4x^7 + 31x^6 + 10x^5 + 23x^4 + 18x^2 + 33x + 2$$

Then $E[2]$ is generated by

$$P_1 = (11\beta^{11} + 19\beta^{10} + \beta^9 + 27\beta^8 + 8\beta^7 + 16\beta^6 + 17\beta^5 + 32\beta^4 + 12\beta^3 + 14\beta^2 + 24\beta + 32 : 0 : 1)$$

$$Q_1 = (15\beta^{11} + 7\beta^{10} + 33\beta^9 + 11\beta^8 + 6\beta^7 + 12\beta^6 + 26\beta^5 + 7\beta^4 + 33\beta^3 + 25\beta^2 + 8\beta + 19 : 0 : 1)$$

Further $E[3]$ is generated by

$$P_2 = (19\beta^{11} + 34\beta^{10} + 3\beta^9 + 29\beta^8 + 7\beta^7 + 3\beta^6 + 18\beta^5 + 21\beta^4 + 23\beta^3 + 30\beta^2 + 23\beta + 25 : 6\beta^{11} + 25\beta^{10} + 4\beta^9 + 13\beta^8 + 10\beta^7 + 23\beta^6 + 20\beta^5 + 30\beta^4 + 24\beta^3 + 6\beta^2 + 17\beta + 5 : 1)$$

$$Q_2 = (31\beta^{11} + 24\beta^{10} + 35\beta^9 + 32\beta^8 + 2\beta^7 + 10\beta^6 + 23\beta^5 + 35\beta^4 + 22\beta^3 + 13\beta^2 + 12\beta + 12 : 18\beta^{11} + 2\beta^{10} + 32\beta^9 + 26\beta^8 + 17\beta^7 + 5\beta^6 + 19\beta^5 + 31\beta^4 + 31\beta^3 + \beta^2 + 22\beta + 1 : 1)$$

For $E[11]$ we must even go to the extension degree 110. So assume $\mathbb{F}_{37^{220}} = \mathbb{F}_{37}[\gamma]$. Then $E[11]$ is generated by P_3 and Q_3 . For the values of $\text{MiPo}_{\mathbb{F}_{37}}(\gamma)$ and P_3, Q_3 see Section 7.

Now we can compute $\phi(P_1), \phi(Q_1), \phi(P_2), \phi(Q_2), \phi(P_3), \phi(Q_3)$ and see that none of them is zero. Since $\deg(\phi) = [\mathcal{O} : \mathbb{Z}[\phi]] \mid [\mathcal{O}_K : \mathbb{Z}[\phi]] = 2 \cdot 3 \cdot 11$, we see that the kernel of ϕ is trivial. Thus no ϕ/n is contained in \mathcal{O} . Therefore we see that

$$\mathcal{O} \cap \mathbb{Z}[\sqrt{D}] = \mathbb{Z}[\phi]$$

The inclusion \supseteq is clear, and for the other direction, note that $\mathcal{O} \cap \mathbb{Z}[\sqrt{D}] = \mathbb{Z} + t\sqrt{D}\mathbb{Z}$ and $\mathbb{Z}[\phi] = \mathbb{Z} + s\sqrt{D}\mathbb{Z}$. Since $\mathbb{Z}[\phi] \subseteq \mathcal{O} \cap \mathbb{Z}[\phi]$ find thus $t \mid s$. Now observe that by choice of ϕ , have $\phi^2 \in \mathbb{Z}$ and so $\phi = s\sqrt{D}$. However, $\phi/\frac{s}{t} = t\sqrt{D} \in \mathcal{O}$. By the above, it follows that $\frac{s}{t} = 1$, i.e. $s = t$.

The index $[\mathcal{O} : \mathbb{Z}[\phi]]$

From the consideration of the torsion points, we see that $\mathcal{O} \cap \mathbb{Z}[\sqrt{D}] = \mathbb{Z}[\phi]$. However, since $[\mathcal{O}_K : \mathbb{Z}[\sqrt{D}]] \leq 2$, we deduce that $[\mathcal{O} : \mathbb{Z}[\phi]] \leq 2$ and so

$$\mathcal{O} = \mathbb{Z}[\pi]$$

My implementation

I have implemented the above algorithm, with computing the torsion groups via division polynomials in Rust, as the SAGE functions for that are extremely slow (apparently, SAGE is not fast when working with polynomials over \mathbb{F}_{p^2} , I assume because elements of \mathbb{F}_{p^2} are considered objects and require dynamic memory allocation etc.). The advantage is that this can be extended to compute kernels of all endomorphisms, and so be used to compute the class group action.

7 P_3 and Q_3

The minimal polynomial of γ is

$$\begin{aligned} & x^{220} + 31x^{219} + 13x^{218} + 21x^{217} + 23x^{216} + 9x^{215} \\ & + 2x^{214} + 35x^{212} + 10x^{211} + 29x^{210} + 25x^{209} + 20x^{208} \\ & + 17x^{207} + 30x^{206} + 5x^{205} + 15x^{204} + 11x^{203} + 10x^{202} \\ & + 11x^{201} + 32x^{200} + 5x^{199} + 28x^{198} + 7x^{197} + 13x^{196} \\ & + 10x^{195} + 32x^{194} + 17x^{193} + 19x^{192} + 36x^{191} \\ & + 17x^{190} + 31x^{189} + 14x^{188} + 6x^{187} + 30x^{186} + 8x^{185} \\ & + 22x^{184} + 2x^{183} + 9x^{182} + 11x^{181} + 6x^{180} + 23x^{179} \\ & + 14x^{178} + 36x^{177} + 16x^{176} + 34x^{175} + 14x^{174} \\ & + 33x^{173} + 14x^{172} + 7x^{171} + 36x^{170} + 18x^{169} + 27x^{168} \\ & + 5x^{167} + 31x^{166} + 6x^{165} + 15x^{164} + 14x^{163} + 17x^{162} \\ & + 7x^{161} + 16x^{160} + 6x^{159} + 29x^{158} + 11x^{157} + 8x^{156} \end{aligned}$$

$$\begin{aligned}
