

Some Notes about the things I encountered

Simon Pohmann

May 25, 2022

Notation

If E is an Elliptic Curve defined over a finite field of characteristic p , we write $E^{(p)}$ for the curve defined by the equations of E after replacing all coefficients by their p -th power. Similarly, for an isogeny $\phi : E \rightarrow E'$, write $\phi^{(p)} : E^{(p)} \rightarrow E'^{(p)}$ for the isogeny defined by the polynomials of ϕ after replacing all coefficients by their p -th power. Furthermore, for a point $P = (x : y : z) \in \mathbb{P}^2$ write $P^{(p)} := (x^p : y^p : z^p)$. Finally, for a set of points or endomorphisms S write $S^{(p)} := \{s^{(p)} \mid s \in S\}$. Note that

$$\begin{aligned} \cdot^{(p)} : \mathbf{Ell} &\rightarrow \mathbf{Ell}, & E &\mapsto E^{(p)} \\ \mathrm{Hom}_{\mathbf{Ell}}(E, E') &\ni \phi \rightarrow \phi^{(p)} \end{aligned}$$

is a covariant endofunctor on the category \mathbf{Ell} of Elliptic Curves defined over $\bar{\mathbb{F}}_p$ and their isogenies.

Sometimes, we abuse terminology and speak of Elliptic Curves when we mean isomorphism classes of Elliptic Curves.

Many examples will be over \mathbb{F}_{101^2} . Let $p = 101$ and $q = p^2$. We usually use the generator $\alpha \in \mathbb{F}_q$ with minimal polynomial $x^2 + 97x + 2$.

1 Example - The cases I, II and III

1.1 Case I

Finding examples of case I is trivial - just take a curve E with $j(E) \in \mathbb{F}_p$. Then clearly $E^{(p)} = E$ and so also $E_0^{(p)} = E_0$ (since $\cdot^{(p)}$ maps the path $E \rightarrow E_0$ to $E = E^{(p)} \rightarrow E_0^{(p)}$).

Furthermore, it is easy to see that there are a lot of curve E such that the associated E_0 is defined over \mathbb{F}_p (and we are again in case I).

1.2 Case II

Here I was not quite sure if it even occurs. As it turns out, it does. Consider E with $j(E) = 17\alpha + 45$. Then $[\mathcal{O}_K : \mathbb{Z}[\pi]] = 2^3$ so E lies on the crater of the 3-isogeny graph. However there is a 3-isogeny $E \rightarrow E^{(p)}$ since $j(E^{(p)}) = j(E)^p = 84\alpha + 12$. In fact, in

First case The fact that the conjugate of $E_i \rightarrow E_{i+1}$ is the dual of $E_{n-i-1} \rightarrow E_{n-i}$ implies that $E_i^{(p)} = E_{n-i}$. In particular, if n is even, we find that $E_{n/2}$ is defined over \mathbb{F}_p .

Note that we have

Proposition 1.1. *Let $[\mathfrak{b}] \in \text{Cl}(\mathcal{O})$ where $\mathcal{O} = \text{End}(E)$ for an ordinary Elliptic Curve E/\mathbb{F}_{p^2} such that $[\mathfrak{b}].E = E^{(p)}$. Then $[\mathfrak{b}]^2 = [(1)]$.*

Proof. I think there is some mistake with my definition of the class group action, see also the next paragraph. With the current (probably wrong) definition, the following works. Otherwise, I suppose that anyway we have $[\mathfrak{b}] = [(p, \pi)]$ and then the claim follows by Lemma 2.5.

We recall the definition of the class group action in the case $[\mathfrak{b}].E^{(p)}$. For an ideal $\mathfrak{b}' \leq \text{End}(E^{(p)})$, have by definition

$$[\mathfrak{b}'].E^{(p)} = E^{(p)}/E^{(p)}[\mathfrak{b}'] = E^{(p)}/\bigcap_{\beta \in \mathfrak{b}'} \ker(\beta)$$

However, \mathfrak{b} is an ideal in $\text{End}(E)$, which is only isomorphic to $\text{End}(E^{(p)})$. Since $\text{End}^0(E)$ is a quadratic imaginary number field, it has one nontrivial field automorphism, and thus the isomorphism $\text{End}(E) \cong \text{End}(E^{(p)})$ is not unique. But there is a unique canonical isomorphism, i.e. an isomorphism that is induced by an (equivalently any) isogeny $\phi : E \rightarrow E^{(p)}$ as

$$\Phi_* : \text{End}(E) \rightarrow \text{End}(E^{(p)}), \quad \alpha \mapsto \frac{1}{\deg(\phi)} \phi \circ \alpha \circ \hat{\phi}$$

This is the isomorphism we use, i.e. we say

$$E^{(p)}[\mathfrak{b}] = E^{(p)}[\Phi_*(\mathfrak{b})] \quad \text{and} \quad [\mathfrak{b}].E^{(p)} = [\Phi_*(\mathfrak{b})].E^{(p)} = E^{(p)}/E^{(p)}[\mathfrak{b}]$$

Now let $\phi : E \rightarrow E/E[\mathfrak{b}] = E^{(p)}$ be a separable isogeny with kernel $E[\mathfrak{b}]$ (by choosing the representative \mathfrak{b} of $[\mathfrak{b}] \in \text{Cl}(\mathcal{O})$ correspondingly, we can assume that). We have

$$\ker(\phi^{(p)}) = E[\mathfrak{b}]^{(p)} = \bigcap_{\beta \in \mathfrak{b}} \ker(\beta)^{(p)} = \bigcap_{\beta \in \mathfrak{b}} \ker(\beta^{(p)}) = \bigcap_{\beta \in \mathfrak{b}^{(p)}} \ker(\beta)$$

Now note that the Frobenius isogeny $\pi : E \rightarrow E^{(p)}$, $P \mapsto P^{(p)}$ induces the canonical isomorphism $\text{End}(E) \rightarrow \text{End}(E^{(p)})$ and so the image of \mathfrak{b} under that isomorphism is $\mathfrak{b}' = \mathfrak{b}^{(p)} \leq \text{End}(E^{(p)})$. Thus

$$\bigcap_{\beta \in \mathfrak{b}^{(p)}} \ker(\beta) = \bigcap_{\beta \in \mathfrak{b}'} \ker(\beta) = E^{(p)}[\mathfrak{b}'] = E^{(p)}[\mathfrak{b}]$$

So by the uniqueness of the image curve for an isogeny with fixed kernel yields that $E = \text{im}(\phi^{(p)}) = [\mathfrak{b}].E^{(p)}$. Thus $[\mathfrak{b}]^2.E = [\mathfrak{b}].E^{(p)} = E$ and since the class group action is free, we see that $[\mathfrak{b}]^2 = [(1)]$. \square

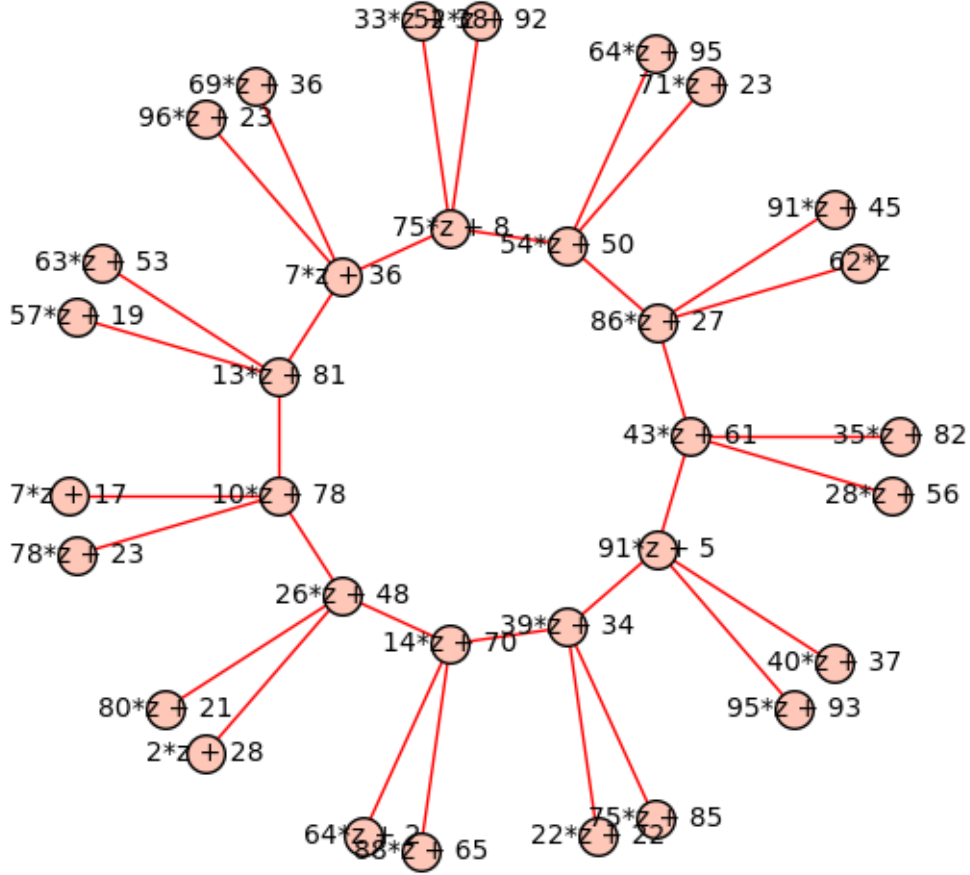

Figure 2: A 3-isogeny volcano over $\mathbb{F}_{101^2} = \mathbb{F}_{101}[\alpha]$ that satisfies case III (in the plot have $z = \alpha$).

From this we get the

Corollary 1.2. *Assume that $E = E_0 \rightarrow E_1 \rightarrow \dots \rightarrow E_n = E$ is the cycle once around the crater (and $j(E) \in \mathbb{F}_{p^2} \setminus \mathbb{F}_p$). If $E^{(p)} = E_i$ then n is even and $i = n/2$, i.e. $E^{(p)}$ is on the other side of the crater².*

Proof. If l does not split in \mathcal{O}_K , then the crater has at most two elements and this is trivial. So assume $(l) = \mathfrak{l}_1 \mathfrak{l}_2$. It is known that then the action of $[\mathfrak{l}_1]$ resp. $[\mathfrak{l}_2]$ corresponds to walking around the crater in one direction resp. the other. So wlog $[\mathfrak{l}_1].E_i = E_{i+1}$.

Now assume that $E^{(p)} = E_i$, so $[\mathfrak{b}].E = E_i = [\mathfrak{l}_1]^i.E$. Since the action is free, it follows that $[\mathfrak{b}] = [\mathfrak{l}_1]^i$. By the previous theorem, we have now $[\mathfrak{l}_1]^{2i} = [\mathfrak{b}]^2 = [(1)]$ and so $[\mathfrak{l}_1]^{2i}.E = E_{2i} = E$. Thus $i = n/2$ and the claim follows. \square

In particular, the path between E and $E^{(p)}$ is likely to have length $\omega(\log(p))$, since the crater is usually large. This is displayed e.g. Figure 1.

1.3 Case III

We give the example displayed in Figure 3. Consider E with $j(E) = 64\alpha + 5$. Then $j(E^{(p)}) = j(E)^p = 37\alpha + 59$. However, we have that E lies on the crater, together with curve of j -invariants

$$88\alpha + 70, 54\alpha + 52, 95\alpha + 11$$

Hence there is no 3-isogeny path from E to $E^{(p)}$. Note that $[\mathcal{O}_K : \mathbb{Z}[\pi]] = 2^2 \cdot 3^2$ but $[\mathcal{O}_K : \text{End}(E)] = 2^2$, which shows that E lies on the crater.

Now we want to have a closer look onto the class group action in this case. Have $d(\text{End}(E)) = -320$, so $K = \mathbb{Q}(\sqrt{-5})$ and $d(\mathcal{O}_K) = -5$. Hence, we have $\text{End}(E) \cong \mathbb{Z}[4\sqrt{-5}]$ and $\mathcal{O}_K \cong \mathbb{Z}[\sqrt{-5}]$.

Sage tells us that $h(\mathcal{O}_K) = 2$ and $h(\text{End}(E)) = 8$. With this, we can already see that

$$64\alpha + 5, 88\alpha + 70, 54\alpha + 52, 95\alpha + 11$$

and

$$(64\alpha + 5)^p, (88\alpha + 70)^p, (54\alpha + 52)^p, (95\alpha + 11)^p$$

is the set of j -invariants of all Elliptic Curves with endomorphism ring $\cong \text{End}(E)$. On this set, $\text{Cl}(\mathbb{Z}[4\sqrt{-5}])$ then acts freely and transitively. Now it would be of course interesting to find out how $\text{Cl}(\mathbb{Z}[4\sqrt{-5}])$ really looks like.

2 Properties of the endomorphism ring vs the cases

Proposition 2.1. *Let E be an ordinary Elliptic Curve defined over a finite field of characteristic p .*

- $\text{End}(E)$ has an element of norm p iff $j(E) \in \mathbb{F}_p$.

²Note that this does not hold if $E, E^{(p)}$ are not in the same crater, see Figure 2.

Figure 3: A 3-isogeny vulcano over $\mathbb{F}_{101^2} = \mathbb{F}_{101}[\alpha]$ that satisfies case III (in the plot have $z = \alpha$).

- $\text{End}(E)$ has a nontrivial element (i.e. $\neq \epsilon p$ for a unit ϵ) of norm p^2 iff $j(E) \in \mathbb{F}_{p^2}$.

Proof. The direction \Leftarrow is clear, as the norm of the q -th power Frobenius endomorphism is q .

For the direction \Rightarrow , assume there is an element $\alpha \in \text{End}(E)$ with $N(\alpha) = p$. If α is inseparable (as isogeny), then we have that it factors through the p -th power Frobenius endomorphism π , and thus $\alpha = \lambda \circ \pi$ for an isomorphism $\lambda : E^{(p)} \rightarrow E$. Thus $j(E^{(p)}) = j(E)$.

On the other hand, if α is separable, it must have kernel of size p , so $\ker(\alpha) = E[p]$ since $\#E[p] = p$ (E is ordinary). Thus $\ker(\alpha) \subseteq \ker([p])$ and we see that $[p]$ factors through α as $[p] = \psi \circ \alpha$. Now have that $\deg(\psi) = p = p^2/\deg(\alpha)$ and clearly ψ is inseparable. The claim follows as above.

For the second point, assume $\alpha \in \text{End}(E)$ has norm $N(\alpha) = p^2$ and $\alpha \neq \pm p$. If α is purely inseparable, we are done. If α is separable, its kernel must be $E[p^2]$ and so it factors through $[p^2]$. Since $[p^2]$ has inseparability degree p^2 , we see that $[p^2] = \pi^2 \circ \alpha$ where π is the p -th power Frobenius morphism. Since α is an endomorphism of E , find $\pi^2 : E \rightarrow E$, thus $j(E) \in \mathbb{F}_{p^2}$.

Finally, if α has inseparability degree p , then its kernel must be $E[p]$ and so $\alpha = \beta \circ \pi$ where $\beta : E^{(p)} \rightarrow E$ is separable with kernel $E^{(p)}[p]$. However, by the uniqueness of the separable isogeny with kernel $E^{(p)}[p]$, we know that (up to isomorphism) also $[p]$ is $\beta \circ \pi$. This now implies that $\alpha = \epsilon p$ for some unit ϵ . \square

Proposition 2.2. *Let $D < 0$. Then the curves E with $\text{End}(E) = \mathbb{Z}[\sqrt{D}]$ have $j(E) \in \mathbb{F}_{p^2} \setminus \mathbb{F}_p$ if and only if*

$$a^2 - b^2 D = p$$

has no solution $a, b \in \mathbb{Z}$ and

$$a^2 - b^2 D = p$$

has a nontrivial solution $a, b \in \mathbb{Z}$.

Let E/\mathbb{F}_{p^2} be an ordinary Elliptic Curve and write $\mathcal{O} := \text{End}(E)$, $\mathcal{K} := \text{End}(E) \otimes \mathbb{Q}$. Let π be the $q = p^2$ -th power Frobenius endomorphism and let t be its trace. Assume $p \neq 2$.

Lemma 2.3. *Have $(p) = (p, \pi)(p, \pi - t)$ in $\mathbb{Z}[\pi]$, \mathcal{O} resp. $\mathcal{O}_{\mathcal{K}}$.*

Proof. Have

$$(p, \pi)(p, \pi - t) = (p^2, p\pi, p\pi - pt, \pi^2 - t\pi) = (p^2, pt, p\pi, -p^2) = (up^2 + vtp, \dots) = (p)$$

where $up + vt = 1$ (note that $t \perp p$ since E is ordinary). \square

Lemma 2.4. *(p, π) is principal (in \mathcal{O}) if and only if E/\mathbb{F}_p .*

Proof. If (p, π) is principal, then its generator is an element of norm p , so E/\mathbb{F}_p . On the other hand, if E/\mathbb{F}_p , then the p -th power Frobenius endomorphism π_p satisfies $p = \pi_p(t_p - \pi_p)$, $\pi = \pi_p^2$ and $\pi_p = u(\pi + p) + v\pi_p p$, where t_p is its trace and $ut + vp = 1$. \square

$j(E)$	$h(\text{End}(E))$	$[\mathcal{O}_K : \mathbb{Z}[\phi]]$
α	36	6
$4\alpha + 99$	64	2

Table 1: Table of class numbers of $\text{End}(E)$ for Elliptic Curves $E/\mathbb{F}_{101^2} = \mathbb{F}_{101}[\alpha]$.

There must be some problem in my definition of the class group action, as it can happen that $[(p, \pi)]$ is not $[(1)]$, but $E[(p, \pi)]$ is clearly trivial, so³ $(p, \pi).E = E/E[(p, \pi)] = E$. However, this contradicts the freeness of the class group action.

Lemma 2.5. *Assume $j \neq 0, 1728$. $[(p, \pi)]$ has order ≤ 2 in $\text{Cl}(\mathcal{O})$ resp. $\text{Cl}(\mathcal{O}_K)$.*

Proof. Since E/\mathbb{F}_{p^2} , we know that there is a nontrivial element α of norm p^2 . Now have in \mathcal{O}_K that $(\alpha)|(p)^2$ and with $p = (p, \pi)(p, \pi - t)$ have thus $(\alpha) = (p)$ or $(\alpha) = (p, \pi)^2$ or $(\alpha) = (p, \pi - t)^2$. However, by assumption we only have units ± 1 in \mathcal{O}_K resp. \mathcal{O} , so the first case is impossible, as it implies $\alpha = \pm p$.

Note that $[(p, \pi)] = [(p, \pi - t)^{-1}]$, so wlog assume $(\alpha) = (p, \pi)^2$. It follows that $(p, \pi)^2$ is principal, so $[(p, \pi)]^2 = [(1)]$. \square

3 Example - The ordinary endomorphism ring

The information in this section is all known material - I just wanted to understand properly how one can compute the endomorphism ring, and what problems occur.

Consider the finite field

$$\mathbb{F}_q = \mathbb{F}_{37^2} = \mathbb{F}_{37} + \alpha\mathbb{F}_{37}$$

where $\alpha^2 + 33\alpha + 2 = 0$. Further, consider the Elliptic Curve E/\mathbb{F}_q with j -invariant 3α , given by

$$E : y^2 = x^3 + (15\alpha + 17)x + (5\alpha + 3)$$

Then we find that the q -th power Frobenius endomorphism π satisfies the minimal equation

$$\pi^2 + 47\pi + 1369$$

and in particular, its trace is -47 . Hence, the number field $\mathcal{K} := \mathcal{O} \otimes \mathbb{Q}$ where $\mathcal{O} = \text{End}(E)$ contains $\sqrt{47^2 - 4 \cdot 1369} = \sqrt{-3^3 \cdot 11^2}$. We observe that $\mathcal{K} = \mathbb{Q}(\sqrt{-3})$ and has discriminant -3 . Furthermore the ring of integers is $\mathcal{O}_K = \mathbb{Z}[\frac{1}{2}(1 + \sqrt{-3})]$.

Knowing the number field, we want to find the endomorphism ring. First, observe that the Frobenius order $\mathbb{Z}[\pi]$ has conductor 33. Now consider the endomorphism

$$\phi := 2\pi + 47$$

The advantage is that we can evaluate ϕ on points of E , but evaluating $\pi + 47/2$ is not so easy. Clearly $[\mathbb{Z}[\pi] : \mathbb{Z}[\phi]] = 2$ and so $\mathbb{Z}[\phi]$ has conductor 66.

³We know that (p, π) is invertible, as $\frac{1}{p}(p, \pi)(p, \pi - t) = (1)$.

Torsion points

In order to find whether $\phi/n \in \mathcal{O}$, we factor $66 = 2 \cdot 3 \cdot 11$ and compute the corresponding torsion groups. This turns out to be quite difficult.

Assume $\mathbb{F}_{37^{12}} = \mathbb{F}_{37}[\beta]$ with

$$\text{MiPo}_{\mathbb{F}_{37}}(\beta) = x^{12} + 4x^7 + 31x^6 + 10x^5 + 23x^4 + 18x^2 + 33x + 2$$

Then $E[2]$ is generated by

$$\begin{aligned} P_1 &= (11\beta^{11} + 19\beta^{10} + \beta^9 + 27\beta^8 + 8\beta^7 + 16\beta^6 + 17\beta^5 + 32\beta^4 + 12\beta^3 + 14\beta^2 + 24\beta + 32 : 0 : 1) \\ Q_1 &= (15\beta^{11} + 7\beta^{10} + 33\beta^9 + 11\beta^8 + 6\beta^7 + 12\beta^6 + 26\beta^5 + 7\beta^4 + 33\beta^3 + 25\beta^2 + 8\beta + 19 : 0 : 1) \end{aligned}$$

Further $E[3]$ is generated by

$$\begin{aligned} P_2 &= (19\beta^{11} + 34\beta^{10} + 3\beta^9 + 29\beta^8 + 7\beta^7 + 3\beta^6 + 18\beta^5 + 21\beta^4 + 23\beta^3 + 30\beta^2 + 23\beta + 25 \\ &\quad : 6\beta^{11} + 25\beta^{10} + 4\beta^9 + 13\beta^8 + 10\beta^7 + 23\beta^6 + 20\beta^5 + 30\beta^4 + 24\beta^3 + 6\beta^2 + 17\beta + 5 : 1) \\ Q_2 &= (31\beta^{11} + 24\beta^{10} + 35\beta^9 + 32\beta^8 + 2\beta^7 + 10\beta^6 + 23\beta^5 + 35\beta^4 + 22\beta^3 + 13\beta^2 + 12\beta + 12 \\ &\quad : 18\beta^{11} + 2\beta^{10} + 32\beta^9 + 26\beta^8 + 17\beta^7 + 5\beta^6 + 19\beta^5 + 31\beta^4 + 31\beta^3 + \beta^2 + 22\beta + 1 : 1) \end{aligned}$$

For $E[11]$ we must even go to the extension degree 110. So assume $\mathbb{F}_{37^{220}} = \mathbb{F}_{37}[\gamma]$. Then $E[11]$ is generated by P_3 and Q_3 . For the values of $\text{MiPo}_{\mathbb{F}_{37}}(\gamma)$ and P_3, Q_3 see Section 4.

Now we can compute $\phi(P_1), \phi(Q_1), \phi(P_2), \phi(Q_2), \phi(P_3), \phi(Q_3)$ and see that none of them is zero. Since $\deg(\phi) = [\mathcal{O} : \mathbb{Z}[\phi]] \mid [\mathcal{O}_K : \mathbb{Z}[\phi]] = 2 \cdot 3 \cdot 11$, we see that the kernel of ϕ is trivial. Thus no ϕ/n is contained in \mathcal{O} . Therefore we see that

$$\mathcal{O} \cap \mathbb{Z}[\sqrt{D}] = \mathbb{Z}[\phi]$$

The inclusion \supseteq is clear, and for the other direction, note that $\mathcal{O} \cap \mathbb{Z}[\sqrt{D}] = \mathbb{Z} + t\sqrt{D}\mathbb{Z}$ and $\mathbb{Z}[\phi] = \mathbb{Z} + s\sqrt{D}\mathbb{Z}$. Since $\mathbb{Z}[\phi] \subseteq \mathcal{O} \cap \mathbb{Z}[\phi]$ find thus $t \mid s$. Now observe that by choice of ϕ , have $\phi^2 \in \mathbb{Z}$ and so $\phi = s\sqrt{D}$. However, $\phi/\frac{s}{t} = t\sqrt{D} \in \mathcal{O}$. By the above, it follows that $\frac{s}{t} = 1$, i.e. $s = t$.

The index $[\mathcal{O} : \mathbb{Z}[\phi]]$

From the consideration of the torsion points, we see that $\mathcal{O} \cap \mathbb{Z}[\sqrt{D}] = \mathbb{Z}[\phi]$. However, since $[\mathcal{O}_K : \mathbb{Z}[\sqrt{D}]] \leq 2$, we deduce that $[\mathcal{O} : \mathbb{Z}[\phi]] \leq 2$ and so

$$\mathcal{O} = \mathbb{Z}[\pi]$$

4 P_3 and Q_3

The minimal polynomial of γ is

$$\begin{aligned}
& x^{220} + 31x^{219} + 13x^{218} + 21x^{217} + 23x^{216} + 9x^{215} \\
& + 2x^{214} + 35x^{212} + 10x^{211} + 29x^{210} + 25x^{209} + 20x^{208} \\
& + 17x^{207} + 30x^{206} + 5x^{205} + 15x^{204} + 11x^{203} + 10x^{202} \\
& + 11x^{201} + 32x^{200} + 5x^{199} + 28x^{198} + 7x^{197} + 13x^{196} \\
& + 10x^{195} + 32x^{194} + 17x^{193} + 19x^{192} + 36x^{191} \\
& + 17x^{190} + 31x^{189} + 14x^{188} + 6x^{187} + 30x^{186} + 8x^{185} \\
& + 22x^{184} + 2x^{183} + 9x^{182} + 11x^{181} + 6x^{180} + 23x^{179} \\
& + 14x^{178} + 36x^{177} + 16x^{176} + 34x^{175} + 14x^{174} \\
& + 33x^{173} + 14x^{172} + 7x^{171} + 36x^{170} + 18x^{169} + 27x^{168} \\
& + 5x^{167} + 31x^{166} + 6x^{165} + 15x^{164} + 14x^{163} + 17x^{162} \\
& + 7x^{161} + 16x^{160} + 6x^{159} + 29x^{158} + 11x^{157} + 8x^{156} \\
& + 15x^{155} + 20x^{154} + 17x^{153} + 7x^{152} + 8x^{151} + 6x^{150} \\
& + 12x^{149} + 36x^{148} + 7x^{147} + 3x^{146} + 25x^{145} + 13x^{144} \\
& + 6x^{143} + 17x^{142} + 22x^{141} + 9x^{140} + 18x^{139} + 36x^{138} \\
& + x^{137} + 6x^{136} + 36x^{135} + 33x^{134} + 32x^{133} + 35x^{132} \\
& + 33x^{131} + 7x^{130} + 3x^{129} + 7x^{128} + 20x^{127} + 31x^{126} \\
& + 26x^{125} + 6x^{124} + 9x^{123} + 10x^{122} + 25x^{121} + 33x^{120} \\
& + 33x^{119} + 30x^{118} + 34x^{117} + 22x^{116} + 8x^{115} + 10x^{114} \\
& + 36x^{113} + 26x^{112} + 8x^{111} + 33x^{110} + 30x^{109} + 11x^{108} \\
& + 14x^{107} + 22x^{106} + 26x^{105} + 11x^{104} + 35x^{103} \\
& + 34x^{102} + 33x^{101} + 27x^{100} + 14x^{99} + 31x^{98} + 24x^{97} \\
& + x^{96} + 6x^{95} + 36x^{93} + 32x^{92} + 18x^{91} + 36x^{90} + 3x^{89} \\
& + 22x^{88} + 36x^{87} + 6x^{86} + 20x^{85} + 25x^{84} + 8x^{82} \\
& + 34x^{81} + 7x^{80} + 25x^{79} + 21x^{78} + 17x^{77} + 29x^{76} \\
& + 5x^{75} + 19x^{74} + 19x^{73} + 8x^{72} + 8x^{71} + 26x^{70} \\
& + 7x^{69} + 27x^{68} + 10x^{67} + 31x^{66} + 4x^{65} + 29x^{64} \\
& + 36x^{62} + 3x^{61} + 27x^{60} + 13x^{59} + 23x^{58} + 33x^{57} \\
& + 14x^{56} + 19x^{55} + 12x^{54} + 20x^{53} + 32x^{52} + 18x^{51} \\
& + 20x^{49} + 20x^{48} + x^{47} + 17x^{46} + 16x^{45} + 4x^{44} \\
& + 12x^{43} + 7x^{42} + 34x^{41} + 9x^{40} + 16x^{39} + 10x^{38} \\
& + 25x^{37} + 10x^{36} + 10x^{35} + 28x^{34} + 33x^{33} + 22x^{32} \\
