Some Notes about the things I encountered

Simon Pohmann

May 20, 2022

Many examples will be over $\mathbb{F}_{101^2}$. Let $p = 101$ and $q = p^2$. We usually use the generator $\alpha \in \mathbb{F}_q$ with minimal polynomial $x^2 + 97x + 2$.

1 Example - The cases I, II and III

1.1 Case I

Finding examples of case I is trivial - just take a curve E with $j(E) \in \mathbb{F}_p$. Then clearly $E^{(p)} = E$ and so also $E_0^{(p)} = E_0$ (since $\cdot^{(p)}$ maps the path $E \to E_0$ to $E = E^{(p)} \to E_0^{(p)}$).

Furthermore, it is easy to see that there are a lot of curve E such that the associated E_0 is defined over $\mathbb{F}_p$ (and we are again in case I).

1.2 Case II

Here I was not quite sure if it even occurs. As it turns out, it does. Consider E with $j(E) = 17\alpha + 45$. Then $[\mathcal{O}_{\mathcal{K}} : \mathbb{Z}[\pi]] = 2^3$ so E lies on the crater of the 3-isogeny graph. However there is a 3-isogeny $E \to E^{(p)}$ since $j(E^{(p)}) = j(E)^p = 84\alpha + 12$. In fact, in this case, the crater consists only of E and $E^{(p)}$. For a more interesting example, see Figure 1.

Further, when we consider the path $E = E_0 \to ... \to E_n = E^{(p)}$ on the crater, there are more or less two possibilities for the $\cdot^{(p)}$ conjugate path[1].

- It could be that the conjugate of $E_i \to E_{i+1}$ is the dual of $E_{n-i-1} \to E_{n-i}$, hence we just go the path $E \to ... \to E^{(p)}$ backwards.
- It could be that the conjugate of $E_i \to E_{i+1}$ is $E_{n+i} \to E_{n+i+1}$, where

$$E_0, ..., E_n, E_{n+1}, ..., E_{n+m} = E_0$$

is the cycle along the whole crater.

Both cases have interesting consequences:

[1] Remember that $\cdot^{(p)}$ is functorial, hence we can also apply to isogenies $E_i \to E_{i+1}$

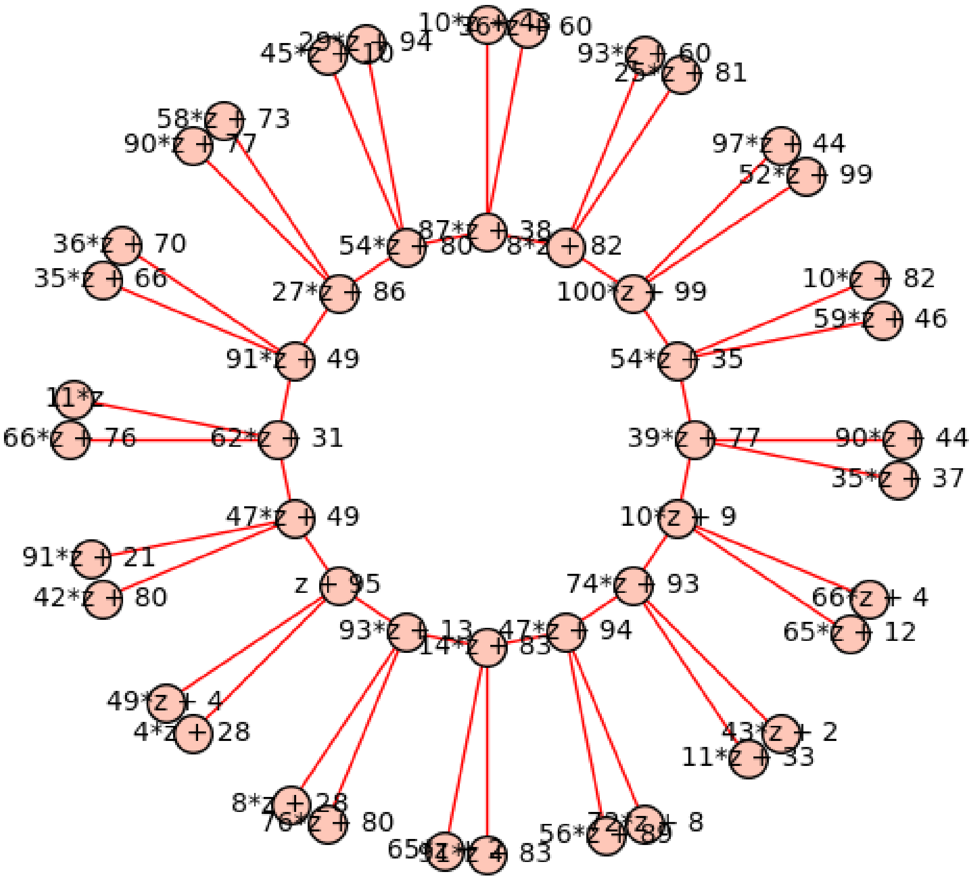

Figure 1: A 3-isogeny vulcano over $\mathbb{F}_{101^2} = \mathbb{F}_{101}[\alpha]$ that satisfies case II (in the plot have $z = \alpha$). Note that e.g. $(39\alpha + 77)^{101} = 62\alpha + 31$.

First case The fact that the conjugate of $E_i \to E_{i+1}$ is the dual of $E_{n-i-1} \to E_{n-i}$ implies that $E_i^{(p)} = E_{n-i}$. In particular, if n is even, we find that $E_{n/2}$ is defined over $\mathbb{F}_p$.

Note that we have

Proposition 1.1. *Let E be an ordinary Elliptic Curve defined over a finite field of characteristic p. Then $\mathrm{End}(E)$ has an element of norm p if and only if $j(E) \in \mathbb{F}_p$.*

Proof. The direction $\Leftarrow$ is clear, as the norm of the p-th power Frobenius endomorphism is p. For the direction $\Rightarrow$, assume there is an element $\alpha \in \mathrm{End}(E)$ with $N(\alpha) = p$. If α is inseparable (as isogeny), then we have that it factors through the p-th power Frobenius endomorphism π, and thus $\alpha = \lambda \circ \pi$ for an isomorphism $\lambda : E^{(p)} \to E$. Thus $j(E^{(p)}) = j(E)$.

On the other hand, if α is separable, it must have kernel of size p, so $\ker(\alpha) = E[p]$ since $\#E[p] = p$ (E is ordinary). Thus $\ker(\alpha) \subseteq \ker([p])$ and we see that $[p]$ factors through α as $[p] = \psi \circ \alpha$. Now have that $\deg(\psi) = p = p^2/\deg(\alpha)$ and clearly ψ is inseparable. The claim follows as above. $\square$

In particular, it follows that either all or none of the curves on the crater of the vulcano have $j(E) \in \mathbb{F}_p$.

Proposition 1.2. *Let $[\mathfrak{b}] \in \mathrm{Cl}(\mathcal{O})$ where $\mathcal{O} = \mathrm{End}(E)$ for an ordinary Elliptic Curve $E/\mathbb{F}_{p^2}$ such that $[\mathfrak{b}].E = E^{(p)}$. Then $[\mathfrak{b}]^2 = [(1)]$.*

Proof. First, we have a short look on the Galois group action on $\mathrm{Cl}(\mathcal{O})$. Let σ be the unique nontrivial ring automorphism of $\mathcal{O}$ (resp. $\mathcal{K} = \mathcal{O} \otimes_{\mathbb{Z}} \mathbb{Q}$). Consider some invertible ideal $\mathfrak{a} \leq \mathcal{O}$. By [Neu92, p. I.12.4], we know that $\mathfrak{a}_\mathfrak{p} := \mathfrak{a}\mathcal{O}_\mathfrak{p}$ is principal for every prime $\mathfrak{p} \leq \mathcal{O}$. Hence, we have that

$$(\mathfrak{a}\sigma(\mathfrak{a}))_\mathfrak{p} = \mathfrak{a}_\mathfrak{p}\sigma(\mathfrak{a})_\mathfrak{p} = \mathfrak{a}_\mathfrak{p}\sigma(\mathfrak{a}_\mathfrak{p}) = (a)(\sigma(a)) = (N(a))$$

where $\mathfrak{a}_\mathfrak{p} = (a)$, since σ extends to the unique nontrivial field automorphism of $\mathcal{K}$, thus is compatible with localization. Hence $[\sigma\mathfrak{a}] = [\mathfrak{a}]^{-1} \in \mathrm{Cl}(\mathcal{O})$, thus the induced group homomorphism on $\mathrm{Cl}(\mathcal{O})$ is

$$\mathrm{Cl}(\mathcal{O}) \to \mathrm{Cl}(\mathcal{O}), \quad [\mathfrak{a}] \mapsto [\mathfrak{a}]^{-1}$$

Now consider $\mathfrak{b} \leq \mathcal{O}$ with $[\mathfrak{b}].E = E^{(p)}$. Let ϕ be the unique isogeny $\phi : E \to E/E[\mathfrak{b}] = E^{(p)}$. Then

$$\ker(\phi^{(p)}) = E[\mathfrak{b}]^p = \bigcap_{b \in \mathfrak{b}} \ker(b)^p = \bigcap_{b \in \mathfrak{b}} \ker(b^{(p)}) = \bigcap_{b \in \mathfrak{b}^{(p)}} \ker(b) = E^{(p)}[\mathfrak{b}^{(p)}]$$

Recall that the action of $[\mathfrak{a}] \in \mathrm{Cl}(\mathcal{O})$ on $E^{(p)}$ is defined as $E^{(p)}/E^{(p)}[\phi(\mathfrak{a})]$ where $\phi : \mathcal{O} \to \mathrm{End}(E^{(p)})$ is an isomorphism. Since $\mathcal{O}$ only has the nontrivial automorphism σ and $\cdot^{(p)} : \mathcal{O} \to \mathrm{End}(E^{(p)})$ is an isomorphism, we have $\phi = \cdot^{(p)}$ or $\phi = \cdot^{(p)} \circ \sigma$.

If $\phi = \cdot^{(p)}$, have that

$$E^{(p)}/E^{(p)}[\mathfrak{b}^{(p)}] = E^{(p)}/E^{(p)}[\phi(\mathfrak{b})] = [\mathfrak{b}].E^{(p)}$$

and so $[\mathfrak{b}]^2.E = E^{(p)}/E^{(p)}[\mathfrak{b}^{(p)}] = \mathrm{im}(\phi^{(p)}) = E^{(p^2)} = E$. Since the action of $\mathrm{Cl}(\mathcal{O})$ is free, it follows that $[\mathfrak{b}]^2 = [(1)]$.

On the other hand, if $\phi = \cdot^{(p)} \circ \sigma$, by the preliminary analysis, find

$$E^{(p)}/E^{(p)}[\mathfrak{b}^{(p)}] = E^{(p)}/E^{(p)}[\phi(\sigma(\mathfrak{b}))] = [\sigma(\mathfrak{b})].E^{(p)} = [\mathfrak{b}]^{-1}.E^{(p)}$$

□

However, it looks like this might never happens[2].

Second case Since $\cdot^{(p)}$ is functorial, both paths $E_0 \to ... \to E_n$ and $E_n \to ... \to E_{n+m} = E_0$ must have same length, hence $n = m$. This shows that the crater has an even amount of vertices, and E resp. $E^{(p)}$ are on opposite sites of the crater. In particular, the path between them has lengh $\omega(\log(p))$. This is the case in e.g. Figure 1.

1.3 Case III

We give the example displayed in Figure 3. Consider E with $j(E) = 64\alpha + 5$. Then $j(E^{(p)}) = j(E)^p = 37\alpha + 59$. However, we have that E lies on the crater, together with curve of j-invariants

$$88\alpha + 70,\ 54\alpha + 52,\ 95\alpha + 11$$

Hence there is no 3-isogeny path from E to $E^{(p)}$. Note that $[\mathcal{O}_\mathcal{K} : \mathbb{Z}[\pi]] = 2^2 \cdot 3^2$ but $[\mathcal{O}_\mathcal{K} : \mathrm{End}(E)] = 2^2$, which shows that E lies on the crater.

Now we want to have a closer look onto the class group action in this case. Have $d(\mathrm{End}(E)) = -320$, so $\mathcal{K} = \mathbb{Q}(\sqrt{-5})$ and $d(\mathcal{O}_\mathcal{K}) = -5$. Hence, we have $\mathrm{End}(E) \cong \mathbb{Z}[4\sqrt{-5}]$ and $\mathcal{O}_\mathcal{K} \cong \mathbb{Z}[\sqrt{-5}]$.

Sage tells us that $h(\mathcal{O}_\mathcal{K}) = 2$ and $h(\mathrm{End}(E)) = 8$. With this, we can already see that

$$64\alpha + 5,\ 88\alpha + 70,\ 54\alpha + 52,\ 95\alpha + 11$$

and

$$(64\alpha + 5)^p,\ (88\alpha + 70)^p,\ (54\alpha + 52)^p,\ (95\alpha + 11)^p$$

is the set of j-invariants of all Elliptic Curves with endomorphism ring $\cong \mathrm{End}(E)$. On this set, $\mathrm{Cl}(\mathbb{Z}[4\sqrt{-5}])$ then acts freely and transitively. Now it would be of course interesting to find out how $\mathrm{Cl}(\mathbb{Z}[4\sqrt{-5}])$ really looks like.

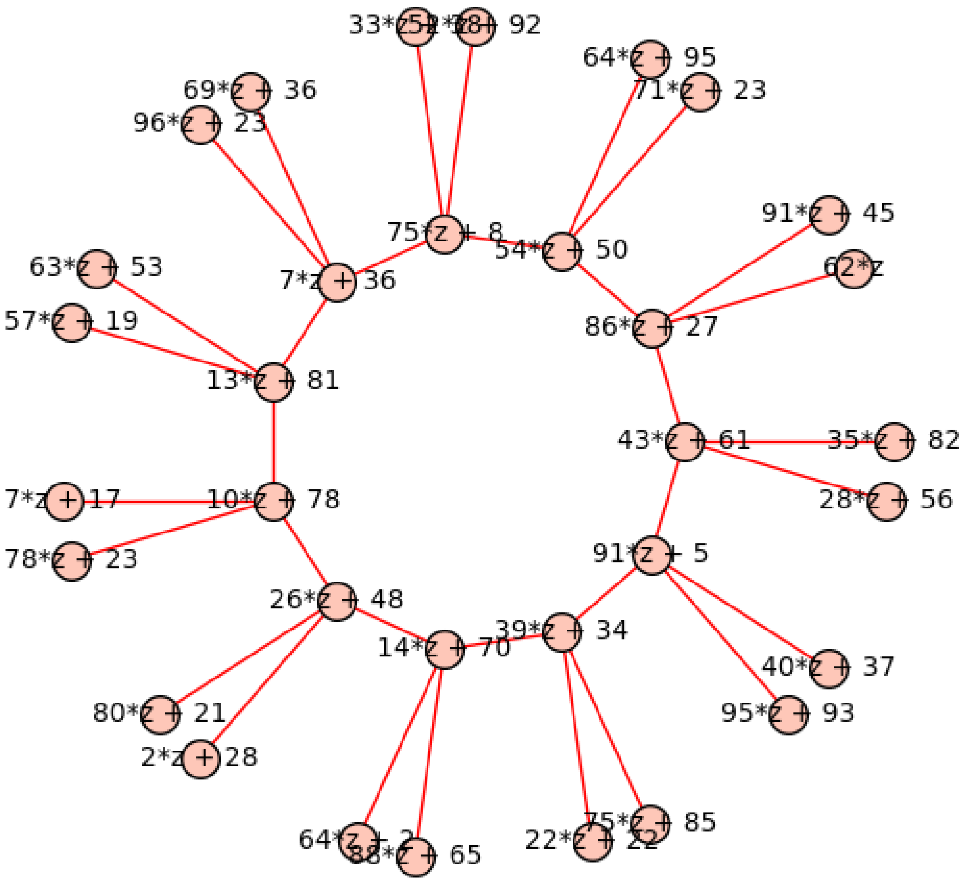

Figure 2: A 3-isogeny vulcano over $\mathbb{F}_{97^2} = \mathbb{F}_{97}[z]$ where the crater has an odd vertex count. Here $\mathrm{MiPo}(z) = x^2 - x + 5$. Note that this satisfies case III, as e.g. $(43z + 61)^{97} = 54z + 7$ is not in this vulcano.

$j(E)$	$h(\mathrm{End}(E))$	$[\mathcal{O}_\mathcal{K} : \mathbb{Z}[\phi]]$
α	36	6
$4\alpha + 99$	64	2

Table 1: Table of class numbers of $\mathrm{End}(E)$ for Elliptic Curves $E/\mathbb{F}_{101^2} = \mathbb{F}_{101}[\alpha]$.

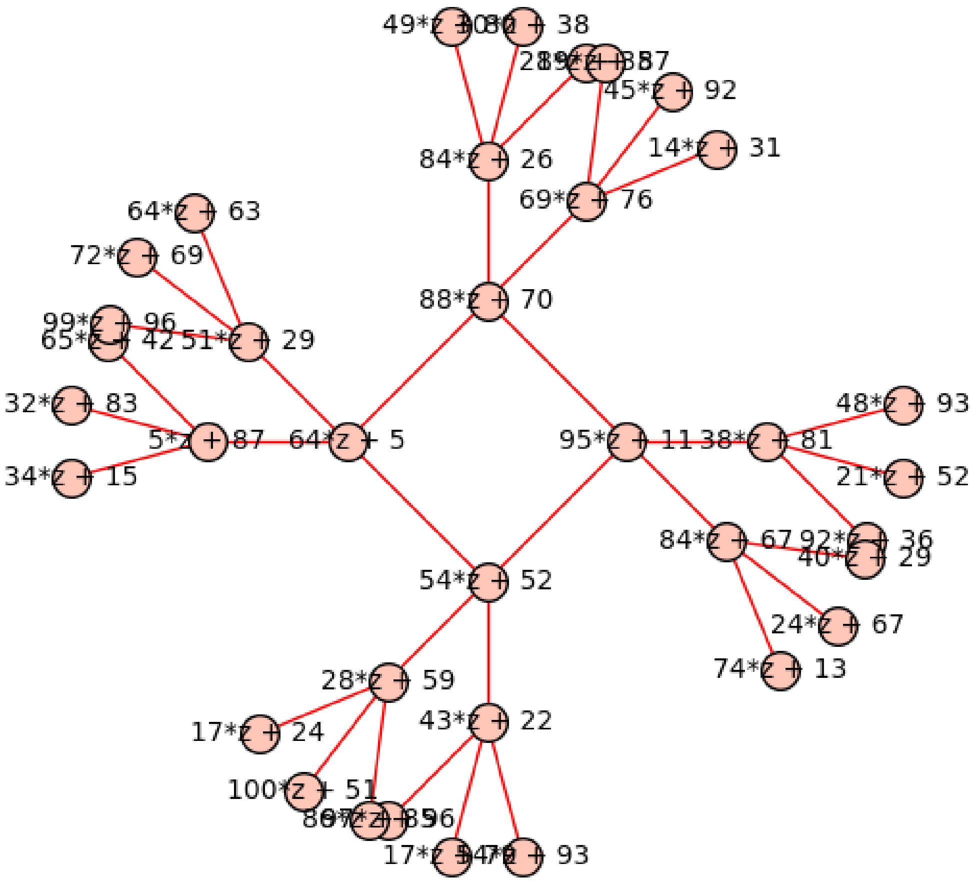

Figure 3: A 3-isogeny vulcano over $\mathbb{F}_{101^2} = \mathbb{F}_{101}[\alpha]$ that satisfies case III (in the plot have $z = \alpha$).

2 Example - The ordinary endomorphism ring

The information in this section is all known material - I just wanted to understand properly how one can compute the endomorphism ring, and what problems occur.

Consider the finite field

$$\mathbb{F}_q = \mathbb{F}_{37^2} = \mathbb{F}_{37} + \alpha\mathbb{F}_{37}$$

where $\alpha^2 + 33\alpha + 2 = 0$. Further, consider the Elliptic Curve $E/\mathbb{F}_q$ with j-invariant 3α, given by

$$E : y^2 = x^3 + (15\alpha + 17)x + (5\alpha + 3)$$

Then we find that the q-th power Frobnenius endomorphism π satisfies the minimal equation

$$\pi^2 + 47\pi + 1369$$

and in particular, its trace is -47. Hence, the number field $\mathcal{K} := \mathcal{O} \otimes \mathbb{Q}$ where $\mathcal{O} = \mathrm{End}(E)$ contains $\sqrt{47^2 - 4 \cdot 1369} = \sqrt{-3^3 \cdot 11^2}$. We observe that $\mathcal{K} = \mathbb{Q}(\sqrt{-3})$ and has discriminant -3. Furthermore the ring of integers is $\mathcal{O}_{\mathcal{K}} = \mathbb{Z}[\frac{1}{2}(1 + \sqrt{-3})]$.

Knowing the number field, we want to find the endomorphism ring. First, observe that the Frobenius order $\mathbb{Z}[\pi]$ has conductor 33. Now consider the endomorphism

$$\phi := 2\pi + 47$$

The advantage is that we can evaluate ϕ on points of E, but evaluating $\pi + 47/2$ is not so easy. Clearly $[\mathbb{Z}[\pi] : \mathbb{Z}[\phi]] = 2$ and so $\mathbb{Z}[\phi]$ has conductor 66.

Torsion points

In order to find whether $\phi/n \in \mathcal{O}$, we factor $66 = 2 \cdot 3 \cdot 11$ and compute the corresponding torsion groups. This turns out to be quite difficult.

Assume $\mathbb{F}_{37^{12}} = \mathbb{F}_{37}[\beta]$ with

$$\mathrm{MiPo}_{\mathbb{F}_{37}}(\beta) = x^{12} + 4x^7 + 31x^6 + 10x^5 + 23x^4 + 18x^2 + 33x + 2$$

Then $E[2]$ is generated by

$$P_1 = (11\beta^{11} + 19\beta^{10} + \beta^9 + 27\beta^8 + 8\beta^7 + 16\beta^6 + 17\beta^5 + 32\beta^4 + 12\beta^3 + 14\beta^2 + 24\beta + 32 : 0 : 1)$$
$$Q_1 = (15\beta^{11} + 7\beta^{10} + 33\beta^9 + 11\beta^8 + 6\beta^7 + 12\beta^6 + 26\beta^5 + 7\beta^4 + 33\beta^3 + 25\beta^2 + 8\beta + 19 : 0 : 1)$$

Further $E[3]$ is generated by

$$\begin{aligned} P_2 = (&19\beta^{11} + 34\beta^{10} + 3\beta^9 + 29\beta^8 + 7\beta^7 + 3\beta^6 + 18\beta^5 + 21\beta^4 + 23\beta^3 + 30\beta^2 + 23\beta + 25 \\ &: 6\beta^{11} + 25\beta^{10} + 4\beta^9 + 13\beta^8 + 10\beta^7 + 23\beta^6 + 20\beta^5 + 30\beta^4 + 24\beta^3 + 6\beta^2 + 17\beta + 5 : 1) \\ Q_2 = (&31\beta^{11} + 24\beta^{10} + 35\beta^9 + 32\beta^8 + 2\beta^7 + 10\beta^6 + 23\beta^5 + 35\beta^4 + 22\beta^3 + 13\beta^2 + 12\beta + 12 \\ &: 18\beta^{11} + 2\beta^{10} + 32\beta^9 + 26\beta^8 + 17\beta^7 + 5\beta^6 + 19\beta^5 + 31\beta^4 + 31\beta^3 + \beta^2 + 22\beta + 1 : 1) \end{aligned}$$

[2] Well, it certainly happens if $E^{(p)}$ and E are not in the same vulcano, i.e. we are in case III (see also Figure 2).

For $E[11]$ we must even go to the extension degree 110. So assume $\mathbb{F}_{37^{220}} = \mathbb{F}_{37}[\gamma]$. Then $E[11]$ is generated by P_3 and Q_3. For the values of $\mathrm{MiPo}_{\mathbb{F}_{37}}(\gamma)$ and P_3, Q_3 see Section 3.

Now we can compute $\phi(P_1), \phi(Q_1), \phi(P_2), \phi(Q_2), \phi(P_3), \phi(Q_3)$ and see that none of them is zero. Since $\deg(\phi) = [\mathcal{O} : \mathbb{Z}[\phi]] \mid [\mathcal{O}_{\mathcal{K}} : \mathbb{Z}[\phi]] = 2 \cdot 3 \cdot 11$, we see that the kernel of ϕ is trivial. Thus no ϕ/n is contained in $\mathcal{O}$. Therefore we see that

$$\mathcal{O} \cap \mathbb{Z}[\sqrt{D}] = \mathbb{Z}[\phi]$$

The inclusion $\supseteq$ is clear, and for the other direction, note that $\mathcal{O} \cap \mathbb{Z}[\sqrt{D}] = \mathbb{Z} + t\sqrt{D}\mathbb{Z}$ and $\mathbb{Z}[\phi] = \mathbb{Z} + s\sqrt{D}\mathbb{Z}$. Since $\mathbb{Z}[\phi] \subseteq \mathcal{O} \cap \mathbb{Z}[\phi]$ find thus $t \mid s$. Now observe that by choice of ϕ, have $\phi^2 \in \mathbb{Z}$ and so $\phi = s\sqrt{D}$. However, $\phi/\frac{s}{t} = t\sqrt{D} \in \mathcal{O}$. By the above, it follows that $\frac{s}{t} = 1$, i.e. $s = t$.

The index $[\mathcal{O} : \mathbb{Z}[\phi]]$

From the consideration of the torsion points, we see that $\mathcal{O} \cap \mathbb{Z}[\sqrt{D}] = \mathbb{Z}[\phi]$. However, since $[\mathcal{O}_{\mathcal{K}} : \mathbb{Z}[\sqrt{D}]] \leq 2$, we deduce that $[\mathcal{O} : \mathbb{Z}[\phi]] \leq 2$ and so

$$\mathcal{O} = \mathbb{Z}[\pi]$$

3 P_3 and Q_3

The minimal polynomial of γ is

```
x^220 + 31*x^219 + 13*x^218 + 21*x^217 + 23*x^216 + 9*x^215
